

Exercise (Instructions): NPM Scripts Part 1

Objectives and Outcomes

In this exercise, you will learn to set up NPM scripts by modifying the *package.json* file. At the end of this exercise, you will be able to:

- Watch for changes to the *styles.scss* file and automatically compile it to the *css* file.
- Run multiple NPM scripts in parallel using *parallelshell* NPM module.

Moving JS to Script file

- Create a folder named *js* and in that folder create a file named *scripts.js*.
- Open *index.html* and from this file cut out all the JQuery script that we added to it and move the code to the *scripts.js* file that we created above.
- Then, update the *index.html* file to include the *scripts.js* file by adding the following line:

1	<code><script src="js/scripts.js"></script></code>	

- **NOTE:** If you are doing the exercise on a Windows computer, please use the following two script items instead of the above:

- You will also update the start script as follows:

1	<code>"start": "npm run watch:all",</code>	

- Then, type the following at the prompt to start watching for changes to the SCSS file, compile it to CSS, and run the server:

1	<code>npm start</code>	

- Now, whenever you make any changes to *styles.scss* file, it will automatically be compiled to the corresponding *css* file.
- Do a Git Commit with the message "NPM Scripts Part 1".
